

II. Matrix Product States

In this chapter, we will consider one-dimensional spin chains, i.e. $\mathcal{H} = (\mathbb{C}^d)^{\otimes N}$,

$$\bullet \quad \bullet \quad \bullet \quad \bullet \quad \bullet \quad \bullet \quad \bullet \quad \bullet$$

$\dots \mathbb{C}^d \mathbb{C}^d \dots$

with states

$$|\psi\rangle = \sum_{i_1, \dots, i_N=0}^{d-1} c_{i_1 \dots i_N} |i_1, \dots, i_N\rangle$$

1. Construction

Consider $|\psi\rangle = \sum c_{i_1 \dots i_N} |i_1, \dots, i_N\rangle$.

We can think of $c_{i_1 \dots i_N}$ as a tensor with N indices; each index can take d values.

Graphical notation:

$$c_{i_1 \dots i_N} =$$

$i_1 \quad i_2 \quad \dots \quad i_N$
| | | ... | |
┌───────────┐
| c |
└───────────┘

Box = tensor

legs = indices

Since $|4\rangle$ and $c_{i_1 \dots i_N}$ are the same object (once we fix a basis), can also write

$$\boxed{\begin{array}{c} | \dots | \\ |4\rangle \end{array}}.$$

We can also consider

$$c_{i_1 i_2 \dots i_N} = c_{i_1}(i_2 \dots i_N) \text{ as a matrix}$$

with row-index i_1 and column-index $(i_2 \dots i_N)$ (i.e., a multi-index).

Now perform an SVD of $c_{i_1}(i_2 \dots i_N)$:

$$c_{i_1}(i_2 \dots i_N) = \sum_{\alpha_1, \alpha'_1} U_{i_1, \alpha_1} \Lambda_{\alpha_1, \alpha'_1} V_{\alpha'_1}(i_2, \dots, i_N)$$

$$(\text{or } C = U \Lambda V),$$

can replace by $\delta_{\alpha_1, \alpha'_1}$ & $V_{\alpha_1}(\dots)$

with Λ a diagonal matrix, $\Lambda_{\alpha_1, \alpha'_1} = \delta_{\alpha_1, \alpha'_1} \cdot \overset{0}{1}_{\alpha_1}$

and U, V isometries:

$$\sum_{i_1} \overline{U_{i_1, \beta_1}} U_{i_1, \alpha_1} = \delta_{\alpha_1, \beta_1}$$

$$\sum_{i_2 \dots i_n} \overline{V_{\beta_1, (i_2, \dots, i_n)}} V_{\alpha_1, (i_2, \dots, i_n)} = \delta_{\alpha_1, \beta_1}$$

Graphically:

connecting legs denotes contraction: The legs are identified and summed over

E.g.: $i \text{---} [A] \text{---} [B] \text{---} j = \sum_k A_{ik} B_{kj} = (A \cdot B)_{ij}$

matrix product!

The isometry conditions read graphically:

$$\sum_{i_2 \dots i_n} \overline{V}_{\beta_1, (i_2, \dots, i_n)} V_{\alpha_1, (i_2, \dots, i_n)} = \delta_{\alpha_1, \beta_1}.$$

and

single line =
identity matrix

(consistent:

$$\begin{aligned} \boxed{A} \boxed{B} &= A \cdot B \\ &= A \cdot \mathbb{1} \cdot B \\ &= \mathbb{1} \cdot A \cdot B = \dots \end{aligned}$$

Express state $|\psi\rangle$ with U, Λ, V :

$$|\psi\rangle = \sum_{\substack{i_1, i_2, \dots, i_N \\ \alpha_1}} U_{i_1 \alpha_1} \Lambda_{\alpha_1 \alpha_1} V_{\alpha_1, (i_2, \dots, i_N)} |i_1, i_2, \dots, i_N\rangle$$

$$\textcircled{*} = \sum_{\alpha_1} \Lambda_{\alpha_1 \alpha_1} \underbrace{\left(\sum_{i_1} U_{i_1 \alpha_1} |i_1\rangle \right)}_{=: |\ell_{\alpha_1}\rangle} \underbrace{\left(\sum_{i_2, \dots, i_N} V_{\alpha_1, (i_2, \dots, i_N)} |i_2, \dots, i_N\rangle \right)}_{=: |\alpha_1\rangle}$$

$$\langle \ell_p | \ell_\alpha \rangle = \sum_{ij, \alpha, \beta} U_{i\alpha} \overline{U_{j\beta}} \underbrace{\langle j | i \rangle}_{= \delta_{ij}}$$

$$= \sum U_{i\alpha} \overline{U_{i\beta}} = \delta_{\alpha\beta}$$

$\Rightarrow |\ell_\alpha\rangle$ (and $|\alpha\rangle$) ONS!

$\Rightarrow \textcircled{*}$ is the Schmidt decomposition of $|\psi\rangle$

in the partition $\underbrace{1}_A | \underbrace{23 \dots N}_B$, with

$\Lambda_{\alpha_1 \alpha_1} = \text{eig}(\Lambda)$ the Schmidt coefficients!

Now call $U = U^{(1)}$, $\Lambda = \Lambda^{(1)}$, $V = V^{(1)}$

Consider $\Pi_{\alpha_1, i_2, (i_3 \dots i_n)}^{(1)} := \sum_{\alpha_1'} \Lambda_{\alpha_1, \alpha_1'} V_{\alpha_1', (i_2 \dots i_n)}^{(1)}$
new row/col. indices

Perform SVD of $\Pi^{(1)} \equiv \Lambda^{(1)} V^{(1)}$:

$\Lambda^{(2)}$ is diagonal ≥ 0

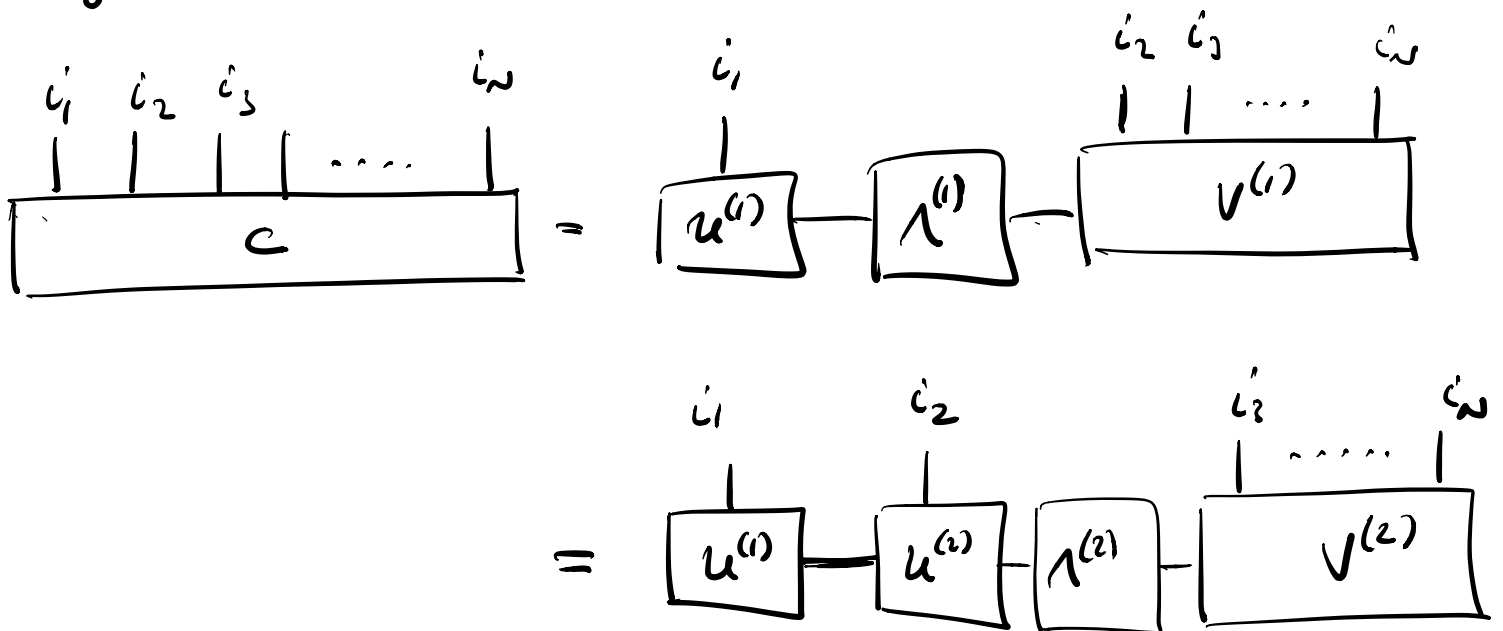

$U^{(2)}, V^{(2)}$ symmetric:

$$(\text{or: } \sum_{\alpha_1, i_2} U_{(\alpha_1, i_2) \alpha_2}^{(2)} \bar{U}_{(\alpha_1, i_2) \beta_2}^{(2)} = \delta_{\alpha_2 \beta_2})$$

Together:

What is the form of the decomposition
in the cut $12|3 \dots N$?

$V^{(2)}$ boundary \Rightarrow right basis $a_2 - \boxed{V}$ is OAB.

is also an isometry (as a map from $\alpha_2 \rightarrow (i, \bar{i})$)

\Rightarrow this is again a Schmidt decomposition,

now in the cut $12/3 \dots N$.

Moreover, if we consider

$$= \begin{array}{c} i_1 \\ | \\ \boxed{u^{(i)}} \end{array} \xrightarrow{\alpha_1} \boxed{\lambda^{(i)}} \xrightarrow{\quad} \begin{array}{c} i_2 \quad i_3 \quad \dots \quad i_N \\ | \quad | \quad \dots \quad | \\ \boxed{v^{(i)}} \end{array}$$

across the cut $1/2 \dots N$, then this still
gives a Schmidt-like decomposition

$$|\psi\rangle = \sum |e_{\alpha}^{(i)}\rangle |\tilde{r}_{\alpha}^{(i)}\rangle$$

$$\text{with } \langle e_{\alpha}^{(i)} | e_{\beta}^{(i)} \rangle = \delta_{\alpha\beta}$$

$$\text{and } \langle \tilde{r}_{\alpha}^{(i)} | \tilde{r}_{\beta}^{(i)} \rangle = \Lambda_{\alpha\alpha} \delta_{\alpha\beta}$$

Orthogonal, and the Schmidt
coefficients sorted in $|\tilde{r}_{\alpha}\rangle$

We can now iterate this scheme and get:

$$\begin{array}{c} i_1 \quad i_2 \quad \dots \quad i_N \\ \boxed{C} \end{array} = \begin{array}{c} i_1 \quad i_2 \quad \dots \quad i_{N-1} \quad i_N \\ \boxed{u^{(1)}} - \boxed{u^{(2)}} - \dots - \boxed{u^{(N-1)}} - \boxed{\wedge^{(N-1)}} - \boxed{v^{(N-1)}} \end{array}$$

with

$$=: \boxed{u^{(N)}}$$

$$\begin{array}{c} \boxed{\bar{u}^{(1)}} \\ | \\ \boxed{u^{(1)}} \end{array} = \left[\quad \right], \quad \begin{array}{c} \boxed{\bar{u}^{(k)}} \\ | \\ \boxed{u^{(k)}} \end{array} = \left[\quad \right] \quad (k=2, \dots, N-1)$$

and thus also

$$\begin{array}{c} \boxed{\bar{u}^{(1)}} - \boxed{\bar{u}^{(2)}} - \dots - \boxed{\bar{u}^{(N)}} \\ | \quad \quad | \quad \quad \quad | \\ \boxed{u^{(1)}} - \boxed{u^{(2)}} - \dots - \boxed{u^{(N)}} \end{array} = \left[\quad \right]$$

$$= \left[\quad \right]$$

$$= \left[\quad \right]$$

— i.e., this representation gives a quasi-Schmidt decomposition in every cut $1 \dots k | (k+1) \dots N$, $k=1, \dots, N-1$:

$$\sum |e_{\alpha}^{(k)}\rangle |\tilde{r}_{\alpha}^{(k)}\rangle,$$

$$\langle e_{\beta}^{(k)} | e_{\alpha}^{(k)} \rangle = \delta_{\alpha\beta}$$

$$\langle \tilde{r}_{\beta}^{(k)} | \tilde{r}_{\alpha}^{(k)} \rangle = \lambda_{\alpha}^{(k)} \delta_{\alpha\beta}$$

 Schmidt coeffs for cut k .

Alternatively, we can consider

$$\begin{array}{c} i_1 \\ | \\ \boxed{u^{(1)}} \end{array} \leftarrow \alpha_1 \quad \text{as a set of row vectors } (u_{i_1}^{(1)})_{\alpha_1},$$

$$\text{and } \begin{array}{c} i_k \\ | \\ \boxed{u^{(k)}} \end{array} \leftarrow \beta_k \quad \text{as matrices } (u_{i_k}^{(k)})_{\alpha_k, \beta_k},$$

$$\text{and } \begin{array}{c} i_N \\ | \\ \boxed{u^{(N)}} \end{array} \leftarrow \alpha_{N+1} \quad \text{as a set of col. vectors } (u_{i_N}^{(N)})_{\alpha_{N+1}}.$$

Then,

$$\begin{array}{c} i_1 \quad i_2 \quad \dots \quad i_{n-1} \quad i_n \\ | \quad | \quad \dots \quad | \quad | \\ \hline C \end{array}$$

$$= \begin{array}{c} i_1 \\ | \\ \boxed{u^{(1)}} \end{array} - \begin{array}{c} i_2 \\ | \\ \boxed{u^{(2)}} \end{array} - \dots - \begin{array}{c} i_{n-1} \\ | \\ \boxed{u^{(n-1)}} \end{array} - \begin{array}{c} i_n \\ | \\ \boxed{u^{(n)}} \end{array}$$

$$= \underbrace{u_{i_1}^{(1)} \cdot u_{i_2}^{(2)} \cdot \dots \cdot u_{i_{n-1}}^{(n-1)} \cdot u_{i_n}^{(n)}}_{\text{vector} \cdot \text{matrix} \cdot \text{matrix} \cdot \dots \cdot \text{vector!}}$$

vector · matrix · matrix · ... · vector!

$$\Rightarrow |\psi\rangle = \sum u_{i_1}^{(1)} \cdot u_{i_2}^{(2)} \cdot \dots \cdot u_{i_{n-1}}^{(n-1)} \cdot u_{i_n}^{(n)} |i_1, \dots, i_n\rangle$$

"Matrix Product State" (MPS)

In general, we have:

$$u_{i_1}^{(1)} : 1 \times D_1 - \text{vector}$$

$$u_{i_2}^{(2)} : D_1 \times D_2 - \text{matrix}$$

$$u_{i_k}^{(k)} : D_{k-1} \times D_k - \text{matrix}$$

⋮

$u_{i_N}^{(N)} : D_{N-1} \times 1$ - vector

We call D_i the "bond dimension".

Observation: We have re-phrased i_1, \dots, i_N as a vector-matrix product!

Did this reduce the # of parameters?

No, this cannot be - this decomposition is exact & cannot reduce # of params.

In fact: At each cut, the bond dimension will generically be $\min(\dim(\text{left}), \dim(\text{right}))$,

e.g. with (d^k, d^{N-k}) , since D_k is the summation range of the Schmidt decomposition!

\Rightarrow the bond dimension will be exponentially big

When we decompose an arbitrary state

$$|\psi\rangle = \sum c_{i_1 \dots i_n} |i_1 \dots i_n\rangle !$$
