3. Applications of entanglement: Tele portation and dance coding

a) Releportation

• A&B share entrangled state 14+2 = 1 (1007 + 1117 AS)

· A has unleusing quantum state

 $|X\rangle_{A'} = \alpha |0\rangle_{A'} + \beta |1\rangle_{A'}$

(Could e.g. also k par of a larger system - huersty!)

· ASB cannot (reliably) transcent grean hum

states, but can communicate classically "for free",

* If the line is unclude, All can shill resent to creak centerflad states 14ts, e.g. by repeat - until - success, or entaugle ment distribution (= loter!), or using "quantum repeaters" (> (ahr!)

Question: Can A get IX> (safely) to B?

Problem; Any measurement of IX's would only reveal partial information, yet destroy stated

Solution: Quantum Releportation!

Teleportation Protocol: A performes uncasurement on AA n. Bell bests $|\phi^{+}\rangle = \frac{1}{12}(100) + (11)$ $|\phi^{-}\rangle = \frac{1}{12} (|00\rangle - |11\rangle) = (2 \propto 1) |\phi^{+}\rangle = (1 \approx 2) (\phi^{+}\rangle)$ $|\psi^{+}\rangle = \frac{1}{12} (|0L\rangle + |10\rangle) = (X = I) |\phi^{+}\rangle = (I = X) |\phi^{+}\rangle$ | ψ >= 1 (lol > - llo>) = (tx ≤ I) | φ +> = (I ≤ x 2) | φ +> We also work the four Bell states as

 $|\phi_{\alpha\beta}\rangle = (\mathcal{Z}^{\alpha}\chi^{\beta} \in \mathcal{I})(\phi^{\dagger}) = (\mathcal{I} \otimes \chi^{\beta}\mathcal{Z}^{\prime})(\phi^{\dagger})$ a, \$ 20,1

126 Outcome probabilities for meas introme 1423: $P_A = tr_B \left[\left| \varphi^+ X \varphi^+ \right|_{AB} \right] = \frac{1}{2} T_A \qquad \text{shake of } A.$ $P_{\alpha\beta} = \langle \phi_{\alpha\beta} | | \chi \chi \chi |_{A^1} \propto \frac{1}{2} I_A | \phi_{\alpha\beta} \rangle$ $= \frac{1}{2} l_{r} \left[\left(|X X X|_{A'} \otimes T_{A} \right) | \phi_{\alpha \beta} X \phi_{\alpha \beta} | \right]$ = $\frac{1}{2} h_{A'} \left[|XXX|_{A'} \cdot h_{R} \left[|\phi_{\alpha\beta} X \phi_{\alpha\beta}| \right] \right]$ = 1/2 T_{A'} $= \frac{1}{2} k \left[1 \chi \chi \chi I_{A} \cdot \frac{1}{2} I_{A} \right]$ = 4 = s equal probability Pag = 1/4 for all ontromes, (This is good - if pas would depend on IX) it would reveal information on 122 and Hus perhals the state!)

What is the state of B after the maturement? 27 i) Outcome 10+>= 100>: hunomahred $\left| \partial_{\sigma\sigma} \right\rangle = \left\langle \phi^{\dagger} \right|_{A'A} \left(\left| \chi \right\rangle_{A'} \otimes \left| \phi^{\dagger} \right\rangle_{AB} \right)$ $=\frac{1}{2}\left(\left< \frac{1}{2} \left(\left< \frac{1}{2} \right) \right|_{A'A} + \left< \frac{1}{2} \right|_{A'A} \right) \left(\left(\frac{1}{2} \left(\left< \frac{1}{2} \right) \right) + \frac{1}{2} \left(\left< \frac{1}{2} \right) \right) \right) \left(\left(\frac{1}{2} \left(\left< \frac{1}{2} \right) \right) + \frac{1}{2} \left(\left< \frac{1}{2} \right) \right) \right) \right)$ = ~<0| + A <1 | A $= \frac{1}{2} \left(\alpha \left[0 \right]_{R} + \beta \left[1 \right]_{R} \right)$ =) State (20) = (X) appears at B! (works with 25% probability.) ii) What about the other outcomes ? A^{1} A^{1} A^{1} A^{1} - B 1 pag>

First cousider < \$ as / 10 - moded gray above ; $\langle \phi_{\alpha\beta} |_{A'A} (\phi^{\dagger}) = \langle \phi^{\dagger} |_{A'B} (I_{A'} \otimes Z_{A}^{\alpha} X_{A}^{\beta}) (\phi^{\dagger})_{A'B}$ $= \langle \phi^{\dagger} |_{A'_{A}} \left(2_{A}^{\prec} X_{A}^{\beta} \cong \mathcal{I}_{B} \right) | \phi^{\dagger} \rangle_{AB}$ $= \langle \phi^{+}|_{A'_{A}} \left(I_{A} \otimes X_{B}^{\prime} Z_{B}^{\prime} \right) | \phi^{+} \rangle_{AB}$ $= \chi_{\mathcal{B}}^{\prime S} \mathcal{Z}_{\mathcal{B}}^{\alpha} < \varphi^{+} |_{A^{\prime}A} |_{\varphi}^{+} \mathcal{Z}_{\mathcal{A}\mathcal{B}}^{+}$ Now compute with dervetien & mpatri) $|\hat{\vartheta}_{xs}\rangle = \langle \varphi_{xs}|_{A'A} (|\chi\rangle_{A'} \otimes (\varphi^{+}\rangle_{AB})$ $= \chi_{B}^{\beta} Z_{B}^{\alpha} < \varphi^{+}|_{A'A} \left(|\chi\rangle_{A'} \otimes |\varphi^{+}\rangle_{AB} \right)$ $\stackrel{\otimes}{=} \frac{1}{2} \chi_{s}$ $= \frac{1}{2} \chi^{\beta} \mathcal{Z}^{\alpha} | \chi \rangle_{\beta} .$

= After A's measurement, B obtains $|\mathcal{V}_{\alpha\beta}\rangle = \chi^{\beta} 2^{\alpha} |\chi\rangle$ with probability 1/4 cech, - average state of B - without leaving reces. result - is $\frac{1}{4} \sum x^{\beta} \frac{z^{\alpha}}{\chi \chi \chi} \frac{1}{2} \frac{z^{\beta}}{\chi} \frac{1}{\chi} \frac{1}$ i.e.: Bob leas no mformation about 12> (n fact: same state as without meas.) 2 A communicates meas outcome (x, β) to B, and 3 B applies $(X^{\beta} z^{\alpha})^{\dagger}$ to their state - Bob obtains $(\chi^{\beta} z^{\alpha})^{\dagger} | \mathcal{I}_{\alpha\beta} \rangle = (\chi^{\beta} z^{\alpha})^{\dagger} (\chi^{\beta} z^{\gamma}) | \chi \rangle = (\chi^{\beta} z^{\alpha})^{\dagger} (\chi^{\beta} z^{\gamma}) | \chi^{\beta} = (\chi^{\beta} z^{\alpha}) | \chi^$ - Bob obtailes IX with probability 1. -> State 12 has been teleported to B. Notes: • No faster-Kan-light Courcerucication (aup, state of B is 2 poior to receiving (a, b) - which has prick transm. speed.)

· Communicating 1 qubit requires 1 "e-67 \$30 (= a max, centengled state 14+> of 1+1 qubit) + 2 5h of classical communication ("c-bib") 14+> 127 Teleportatia protocol - summary: A' A B 1) Reama A, A' m / tap bats. 2 Communicate (xp) from A to B. 3 Apply $(\chi^{\beta} 2^{\alpha})^{\dagger}$ on \mathcal{B} . Can be straight forwardly generalized to Cd. One application of kleportation: Queantum Repeaters We can (reliably) create certanglement over déstance l'- can ve crete entanferment

over déstance 20?

(E.g. Photo lon at const. rate -> prob. to said half of an ent. pair over dist. lis e "

6) Relation between teleportation and the Choi- Jamiollowski iso recorderse

1) Consider "postsclected teleportehon"

8 14+7 propert $|\chi\rangle$ $|\phi^{+}\rangle$ project outo 14+>: "posticle ched" measurmant, r.e. we only consider their outcome

... so Kus is a complicated way of writing the 132 idea they map. (2) Protocol for applying p → E(p): $P \stackrel{A}{\bullet} \stackrel{B}{\bullet} \stackrel{B}{\bullet} \stackrel{Propert}{\bullet} \stackrel{g}{\bullet} \stackrel{Q H G \mathcal{E}}{\bullet} \stackrel{E(P)}{\bullet} \stackrel{C}{\bullet} \stackrel{C}{\bullet}$ 3 Now muchange the order of applying E and projecting - Kney councile (as they act on deft, systems), so their is the same recep: $A = \frac{14^{+}}{\epsilon} = (I)$ $E = \frac{14^{+}}{\epsilon} = (E)$ $e^{pply} E = \frac{14^{+}}{\epsilon} = (E)$ (I) project outo/\$t> C Since orders communte, News is the same as (2), i.e. $\tau = \mathcal{E}(\mathbf{p})'$

Their is the Cho'-famiol house " 180 morphur (!)?

(I) is the E > 0 map ("apply & to half a max entempted thek")

(I) is the one the (' plepat 6 through the Choi stak")

C) Deux coding

Have seen:

· shared intanglement + class. channel -> 9, channel

1 ebit +2 chit -> 1 qubit

Can we do the convese? Use a quantum channel to transmit destical reformation?

Trivially possible by encoding $0 \rightarrow 10$, $1 \rightarrow 11$ $1 quist \longrightarrow 1 chit$

Can we do better if we also share center fecuent?

Darse cooling (sometimes also "ryperdense cooling"):

A (14+7 B

Idea; Eucode two bits on { das } appeq, (an ONB)

() ABB share (\$+7, (2) A can encode two but a flocally: $|\phi_{x}\rangle_{AS} = (2^{x}_{A} \times^{\mu}_{B} = T)|\phi^{+}\rangle_{AS}$ i.e., A applies 2°X to les part of 14+7. 3 A sends her part of the state to B via the quantum coursemication choused, (4) B measures in Rell Saois { 1 pages and recorers a and S.

Shard ent. + 9, channel - class. channel

1ebit + 1qubit -> 2 cloth

d) Optimality of teleportation & dense coding

We can use the teleportation & dense coding protocol mutually to argue that both ar ophual in knus of communication cost. To this card, assume starced ent. is free (i.e.: this is not part of our cast frenchan).

i) Assume we can telepost with r < 2 6th of class. communication per gubit sent (i.e., there are protocols to send kg gubits u/ ke class. bits s.th., $\frac{k_c}{k_q} \rightarrow r$).

Use his "hyper-kleportaha" protocol to send quantum states on the (usrual) deuse coding prot .:

dense coding

send u quests "hyper-kleportation"

send The chits , r<2

- Can compress cless. nformake (in the presence of entanglement).

- i.e., send a bib with keen bib - as long as we have free entrugtement.

This is impossible ! (lubuchively, can also be formalized,)

ii) Assume we can "lappe -deux-code" 2372 class. 5 h per qubit sent.

send 25 class. S.b.

"hypo-dense codry" 137 rend 1 gubit feleportation send 2 cSrb

... and again, we can send 25 til by only fransmitting 2 Sits, ct. ...
